SHARING

RAASM was founded in 1975 in a small barn in the Vicenza Italy countryside.

Combining technological innovation and environmental awareness, over the years the company has grown to become an international benchmark, recognised and appreciated for its product reliability and the quality of the solutions adopted in fluid management and power distribution.

RAASM's products manufacturing takes shape in a unique context, where collective intellect and nature meet to create a human humus capable of responding to today's complex needs.

This philosophy, which underpins the company's activities, finds expression in the **12 hectares of parkland surrounding the production area** and home to numerous protected species of trees and animals, bearing witness to the words of the founder: **'There is no future if, first, the environment is not supported'**.
